Car catalog

Create Spring Boot API for car catalog with information about the cars in it with that database model shown below .

For creation of the model you can use any type of relational database you know.

To complete the task you must:

1. Implement all the CRUD operation for create, update and delete. **Be aware that you must add validation on creation for all mandatory fields because we can't create any of the entities without them and throw exception if any of the mandatory fields are missing in the request.**
2. Implement search functionality on cars. For search criteria must use PRICE, MODEL, BRAND and FUEL_TYPE, REG_DATE, TRANSMISSION_TYPE and ORBER BY PRICE descending.
